NURSING CLINICAL STANDARD

ELECTROLYTE REPLACEMENT: INTRAVENOUS

PURPOSE:

To outline the management of the patient receiving electrolytes for the purpose of routine electrolyte replacement. (It does not apply to electrolyte administration for other therapeutic uses).

SUPPORTIVE DATA:

Electrolyte imbalances may result in cardiovascular and neuromuscular disturbances. Electrolytes should be replaced cautiously in patients with renal insufficiency/failure.

If electrolyte imbalance is critical (see below) or the patient is manifesting signs and/or symptoms (s/s) of electrolyte imbalance, the provider must be notified to evaluate for potential transfer to a monitored area.

Critical Values		
Bicarbonate: less than 14 mEq/L and	Phosphate: less than 1.5 mg/dL	
pH less than 7.2 and with s/s	< 4.5 mg/dl for neonates	
Corrected Calcium: less than 7 mg/dL	Potassium: less than 3 mEq/L	
(or ionized calcium less than 2.5		
mg/dL) and with s/s		
Ionized calcium <4.5 mg/dl for		
neonates		
Magnesium: less than 1.2 mg/dL or	Sodium: less than 120 mEq/L or	
<1.7 mg/dL for neonates	< 130 mEq/L for neonates	

Electrolyte replacement MUST be administered via infusion pump with Guardrails and preferably through a central line, if indicated in guide below.

ASSESSMENT:

- 1. Evaluate serum electrolyte levels prior to infusion.
- 2. Assess the following prior to initiating infusion and a minimum of every 2 hours during infusion (ICU, ED, Progressive Care Unit); every 4 hours (acute care units):
 - Clinical Signs:
 - Alteration in level of consciousness (LOC)
 - Irregular/fast/slow pulse
 - Palpitations
 - Neuromuscular changes: muscle weakness, paresthesias, spasms, tetany, seizures
 - Dysrhythmias and electrocardiogram (ECG) changes (ICU/ ED/ Progressive Care Unit/ Telemetry Unit)

Electrolyte	High	Low
Ca ⁺⁺	Short ST	Prolonged ST and QTI
K^+	Peaked T Widened QRS Prolonged PRI Flat/absent P Depressed ST	Prominent U and P Flat T Depressed ST Prolonged PRI and QT PVCs
Mg ⁺⁺	Peaked T	Flat/inverted T Depressed ST Prolonged QTI PVCs Torsade de pointes
PO ₄	Prolonged ST and QTI	Short ST

- 3. Assess ALL possible sources for electrolyte additives including the following:
 - IV infusions
 - PO/enteral tube intake
- 4. Assess peripheral infusion site for infiltration/phlebitis every 2 hours (Peds, neonates every hour).
- 5. Re-evaluate serum electrolyte values as ordered by provider. The following are recommendations for re-evaluation in the ICU:
 - 2 hour post infusion for calcium, potassium, phosphate
 - 4 hour post infusion for magnesium
 - One hour post infusion for sodium and bicarbonate. Bicarbonate may be monitored using a blood gas
- 6. Ensure order includes:
 - Dose
 - Route
 - Parameters, if any
 - Weight
 - Complete drug name, e.g., Sodium Phosphate vs Potassium Phosphate Calcium Chloride vs Calcium Gluconate
 - Duration of infusion
- 7. Administer pharmacy-prepared solutions. See table as reference for administration.
 - Neonatal and Pediatric administration is highly individualized; consult appropriate clinical resources:
 - Neo Fax (Neonatal)
 - Pharmacists
 - Pediatric Dosage Handbook

SAFETY:

PREPARATION/

ADMINISTRATION:

- 8. Refer to the Electrolyte Administration Guidelines for MAXIMUM TOTAL HOURLY Electrolyte Infusion.
- 9. Administer electrolyte replacement via infusion pump with Guardrails.
- 10. Check drug compatibility with other medications infusing through the same line prior to administration.
- 11. Observe the following:
 - Calcium
 - Do NOT infuse IV calcium and phosphorus simultaneously through the same port/line or separate ports of the same central line (Exception: Total Parenteral Nutrition)
 - If hypocalcemia and hypophosphatemia occur together, infuse calcium first before phosphorus
 - DO NOT infuse calcium and bicarbonate or calcium chloride and magnesium in the same line (Except TPN; check IV

compatibility).

- Do NOT infuse calcium with ceftriaxone
- Calcium Chloride: Extravasation may result in severe tissue necrosis and sloughing

Phosphate

- See calcium section.
- Monitor phosphorous and calcium levels. Induced hyperphosphatemia may result in hypocalcemia

Potassium

- Central line is preferred
- If peripheral line, use large vein, administer concentration of 20 mEq/250 mL and infuse simultaneously attached to maintenance infusion if possible to prevent burning sensation

• Sodium

- Monitor intake and output every hour (ICU/ Progressive Care Unit)
- 12. Notify the provider immediately for:
 - Alteration in LOC
 - Irregular/fast/slow pulses
 - ECG changes, dysrhythmias
 - Palpitations
 - Neuromuscular weakness/paresthesias, spasms, tetany, seizures
 - Persistent abnormal lab values
 - Infiltration

PATIENT/FAMILY TEACHING:

REPORTABLE

CONDITIONS:

- 13. Instruct on the following:
 - Purpose of electrolyte replacement
 - To report to the RN
 - Any discomfort of IV site
 - Any cardiovascular / neuromuscular symptoms

ADDITIONAL STANDARDS:

- 14. Refer to the following as indicated:
 - Intravenous Therapy

DOCUMENTATION:

15. Document in accordance with documentation standards.

ELECTROLYTE REPLACEMENT GUIDELINES, ROUTINE ADULT PATIENTS

The following are standard recommendations:

Electrolyte	Concentration	Dose	Rate
Bicarbonate	50 mEq, 100 mEq or 150 mEq/1000 mL	1 amp (50) mEq Sodium Bicarbonate) 2 amps (100) mEq Sodium Bicarbonate) 3 amps (150 mEq Sodium Bicarbonate)	Start at 2 mEq/Kg over 4-8 hours (ICU/ED: over 4 hours) ICU/ED only: Rate per provider order based upon bicarbonate level." Adult Hematology/Oncology Acute Care Unit & Infusion Center only: Titrate per provider's order according to treatment plan, e.g., tumor lysis, urine pH
Calcium Gluconate	1 gm/50 mL 2 gm/100 mL 3 gm /250 mL	1 - 4 grams (1 gram Calcium Gluconate = 93 mg = 4.65 mEq elemental Calcium)	1 gram/hour
Calcium Chloride Restricted to ICU/ED only	1 gm/50 mL 2 gm/100 mL 3 gm/250 mL	1-4 grams (1 gram Calcium Chloride = approximately 3 grams Calcium Gluconate)	 For emergency or Via central line during Continuous Renal Replacement Therapy or for post cardiac surgery patients only
Magnesium Sulfate	2 gm/50 mL 4 gm/100 mL 5 gm/ 250 mL	2-6 grams (1 gram Magnesium Sulfate = 8 mEq Magnesium)	Maximum: 1 gram/hour
Phosphate (Potassium *or Sodium Phosphate)	15 mMol/250 mL 30 mMol/250 mL (Central line only) 30 mMol/500 mL	15 - 30 mMol Phosphorus Potassium Phosphate: 3 mMol Phosphate and 4.4 mEq Potassium per ml Sodium Phosphate: 3 mMol Phosphate and 4mEq Sodium per ml Acute Care Units: Maximum 30 Mmol/ 24 hours	15 mmol over 4 hours 30 mmol over 6 hours Maximum for severe hypophosphatemia: ICU only: 7.5 mmol/hour (via central line only)

^{*} If potassium chloride and potassium phosphate are being administered at the same time, the MAXIMUM TOTAL AMOUNT of potassium with both infusions remains at:

 Peripheral line - 10 mEq K+/hour Central line - 20 mEq K+/hour 			
Potassium (Potassium Chloride) *	20 mEq/250 mL (Peripheral line) 40 mEq/500 mL (Peripheral line) 20 mEq/50 mL (Central line)	20 - 40 mEq (usually up to 1 mEq/kg or 80 mEq/dose)	10 mEq/hour ICU/ED only: Central Line: 20 mEq/hour (for severe hypokalemia)
Sodium Chloride (Hypertonic Solutions) ICU/ED Only		patient's sodium level, and signs and symptoms Usually IV bolus over 15-30 mi Central line is preferred. If peripheral line is used, IV site must be changed every 12 hours or the maximum infusion rate is 15 mL/hr. Proved to administer saline solutions greater than 0.9% for routine ient is hyponatremic, the physician must be notified to evaluate for	

ELECTROLYTE REPLACEMENT GUIDELINES, ROUTINE PEDIATRIC ACUTE CARE UNIT PATIENTS				
Serum Level	Electrolyte/Dose	Amount/Diluent		Rate
Serum Lever	Electionyte/Dose	Peripheral Infusion	Central Infusion	Rate
Ionized Calcium of less than 4.5 mg/dL (Asymptomatic) Magnesium	Calcium Gluconate 50-100 mg/Kg Maximum 2.5 grams Magnesium Sulfate	Dilute to 50 mg/mL (D5W or NS) 40 mg/ml		- IV over 4 hours - IV over 4 - 6 hours
of less than 1.7 mg/dL	25-50 mg/Kg Maximum 2 grams	(D5W or NS)		- Do not exceed 125 mg/kg/hour
Phosphorus of 1.1 - 2.3 mg/dL	Potassium Phosphate 0.08 mmol/Kg	Dilute to 0.05 mmol/mL (D5W or NS)	Dilute to 0.12 mmol/mL (D5W or NS)	- IV over 6 hours <u>Central Infusion:</u> - Maximum rate
Phosphorus of 0.5 - 1 mg/dL (Cardiac Monitoring)	Potassium Phosphate 0.16-0.24 mmol/Kg			0.05 mmol/Kg/hour
Phosphorus of less than 0.5 mg/dL (Cardiac Monitoring)	Potassium Phosphate 0.36 mmol/Kg			
Potassium of less than 3.5 mmol/L (Cardiac Monitoring)	Potassium Chloride 0.5-1 mEq/Kg IV Maximum dose 40 mEq Cardiac Monitor is required for infusion rate greater than 0.25 mEq/Kg/hr or greater than 10mEq/hr	Maximum dilution 0.08 mEq/mL in D5W or NS	20 mEq in 50 mL sterile water Premade bag. Or 0.4 mEq/mL in NS or D5W.	Peripheral infusion: - Maximum rate 0.25 mEq/Kg/hour - Not to exceed: 10mEq/hour Central Infusion: - Maximum rate 1 mEq/Kg/hour - Not to exceed: 40 mEq/hour

ELECTROLYTE REPLACEMENT GUIDELINES, ROUTINE PEDIATRIC ICU/ED			
Indications	Electrolyte/Dose	Amount/Diluent	Rate
Serum Ionized Calcium less than 4.5 mg/dL	Asymptomatic: Calcium Gluconate 50-100 mg/Kg, maximum 2.5 grams Symptomatic: Calcium Chloride 10mg/kg, maximum 1 gram	Dilute to 50 mg/mL (D5W or NS) *Do NOT infuse with Phosphate containing IV fluids	IV over 4 hours IV over 10 minutes.
Serum Magnesium less than 1.7 mg/dL	Magnesium Sulfate 25-50 mg/Kg/dose Maximum single dose: 2 grams	40 mg/mL in D5W or NS, or use premade bag 2 gm in 50 mL sterile water	- IV over 4-6 hours - Do not exceed 125 mg/kg/hr
Serum Phosphorus 1.1 - 2.3 mg/dL	Potassium Phosphate (low dose)0.08 mmol/Kg	Peripheral Infusion: - Dilute to 0.05 mmol/mL (D5W or NS)	Peripheral Infusion: - IV over 6 hours Central Infusion:
Serum Phosphorus 0.5 - 1 mg/dL Cardiac Monitoring	Potassium Phosphate (intermediate dose) 0.16-0.24 mmol/Kg Maximum 30 mmol	Central Infusion: - Dilute to 0.12 mmol/mL (D5W or NS) *Do NOT infuse with Calcium-	- Maximum rate: 0.05 mmol/Kg/hour
Serum Phosphorus less than 0.5 mg/dL Cardiac Monitoring	Potassium Phosphate (high dose) 0.36 mmol/Kg Maximum 40 mmol	containing IV fluids	
Serum Potassium less than 3.5 mmol/L	Potassium Chloride 0.5-1 mEq/Kg IV Maximum dose 40 mEq	Peripheral Infusion: - Maximum dilution: 40 mEq in 500 mL (D5W or NS) Central Infusion: - Dilute to 15 mEq in 100mL (D5W or NS) - Maximum concentration 20 mEq/50 mL (Premixed from manufacturer)	Maximum rate: 40 mEq over 1 hour Normal rate is 1 mEq/kg/hr up to 40 mEq/hour Peripheral Infusion: - Maximum rate: 10 mEq/hr

Indications	Electrolyte/Dose	Amount/Diluent	Rate
Serum Sodium - less than 130 mEq/L & initial treatment of Acute Serious Symptomatic (i.e. Seizures) Hyponatremia - as a salt replacement solution in severe salt losing conditions (i.e. cerebral salt wasting)	Dose is based upon calculated provider's order *For Hyponatremic Seizures as an initial estimate give 6 mL/kg of 3% NaCL over 60 min. 3% NaCL ~ 0.5 meq/mL	3% NaCl 500 mL premade bag. Central line preferred	Maximum rate of infusion: 1 mEq/kg/hour Usual rate: over 15 – 30 min
Bicarbonate - less than 10 mmol/L & pH < 7.10 (Metabolic Acidosis)	 Sodium Bicarbonate (1 mEq/mL NaHCO3 8.4%) Dose is based upon calculated provider's order Subsequent doses should be based on patient's acid-base status 	Maximum Concentration: 0.5mEq/mL or 1 mEq/mL in D5W or NS (Solution is hypertonic - avoid infiltration or extravasation)	Infuse over 2-4 hours - Maximum rate of infusion: 1 mEq/kg/hour Rate per provider order based upon bicarbonate level.

ELECTROLYTE REPLACEMENT GUIDELINES, NICU			
Indications	Electrolyte/Dose	Amount/Diluent	Rate
Serum Ionized Calcium less than 4.5 mg/dL	Asymptomatic: Calcium Gluconate 50-100 mg/Kg	Dilute to 50 mg/mL (D5W) *Do NOT infuse with Phosphate containing IV fluids	IV over 1 hour
Serum Magnesium less than 1.7 mg/dL	Magnesium Sulfate 25-50 mg/Kg/dose	40 mg/mL in D5W	IV over 1-4 hours Do not exceed 125 mg/kg/hr
Serum Phosphorus 1.1 - 2.3 mg/dL	Potassium or Sodium Phosphate (low dose) NICU: 0.15 – 0.2 mmol/kg	Peripheral Infusion: - Dilute to 0.05 mmol/mL (D5W)	Central and peripheral infusion rate 0.05 mmol/Kg/hour
Serum Phosphorus 0.5 - 1 mg/dL Cardiac Monitoring	Potassium or Sodium Phosphate (intermediate dose) 0.2-0.25 mmol/Kg Maximum 30 mmol	Central Infusion: - Dilute to 0.12 mmol/mL (D5W or NS) *Do NOT infuse with Calciumcontaining IV fluids	
Serum Phosphorus less than 0.5 mg/dL Cardiac Monitoring	Potassium or Sodium Phosphate (high dose) 0.25-0.35 mmol/Kg		
Serum Potassium less than 3.5 mmol/L	Potassium Chloride or Potassium Acetate 0.5-1 mEq/Kg IV	Peripheral Infusion: 0.1 mEq/ mL (D5W) Central Infusion: 0.4 mEq/mL (D5W)	Peripheral and central infusion Maximum rate 0.25 mEq/Kg/hour

Indications	Electrolyte/Dose	Amount/Diluent	Rate
Serum Sodium - less than 130 mEq/L & initial treatment of Acute Serious Symptomatic (i.e. Seizures) Hyponatremia - as a salt replacement solution in severe salt losing conditions (i.e. cerebral salt wasting)	Dose is based upon calculated provider's order *For Hyponatremic Seizures as an initial estimate give 6 mL/kg of 3% NaCL over 60 min. 3% NaCL~ 0.5 mEq/mL	Peripheral Infusion: - Dilute to 0.25 mEq/mL in D5W Central Infusion: - Dilute to 0.5 mEq/mL in D5W	IV over 4 hours (maximum rate of infusion: 1 meq/kg/hr)
Bicarbonate - less than 10 mmol/L & Ph < 7.10 (Metabolic Acidosis)	Sodium Bicarbonate (0.5 meq/ml 4.2% or 1 mEq/mL 8.4% NaHCO3) Dose is based upon calculated provider's order Subsequent doses should be based on patient's acid-base status	Maximum Concentration: 0.5mEq/mL or 1 mEq/mL (for bigger older babies with fluid restriction only) in D5W (Solution is hypertonic – avoid infiltration or extravasation)	Infuse over 30 mins to 1 hour - Maximum rate of infusion: 1 mEq/kg/hour Rate per provider order based upon bicarbonate level.
