## ATTENDING STAFF POLICY & PROCEDURE

Page 1	Of 7
--------	------

Subject: <b>DECLARATION OF DEATH</b>		Original Issue Date: <b>June 5, 2003</b> Supersedes: <b>July 3, 2013</b>	Policy #: <b>ASA 106</b> Effective Date: <b>3/3/2021</b>
Departments Consulted & Approved: Brain Death Committee Office of Risk Management Ethics Resource Committee Fetal, Infant, Child Ethics Committee	Reviewed & Approved by: Credentials and Privileges Advisory Committee Attending Staff Association Executive Committee	Approved by:  (Signature on File)  President, Attending Staff Association	

### PURPOSE

The purpose of this policy is to govern the process for determining death in the LAC+USC Medical Center.

### POLICY

Death occurs when either circulatory and respiratory functions or whole brain neurological functions have ceased and will not spontaneously resume. Therefore, death can be determined by either **Cardiopulmonary** or **Neurological** Criteria. Determination of death shall be limited to qualified physicians acting in conformity with the procedures set forth below.

#### I. DECLARATION OF DEATH BY SPECIAL CIRCUMSTANCES:

Occasionally, patients may be transported to the hospital who exhibit unmistakable signs of death (e.g. decapitation, rigor mortis, livido, decomposition). Such patients may be declared dead on arrival by an attending or resident physician without further cardiopulmonary or neurological evaluation.

#### II. DECLARATION OF DEATH BY CARDIOPULMONARY CRITERIA

##### PHYSICIAN QUALIFICATIONS:

Any attending physician with active staff privileges and any resident physician in a training program at LAC+USC Medical Center may declare death by cardiopulmonary criteria in accord with the procedures set forth below.

### PROCEDURES

1. Declaration of death by cardiopulmonary criteria requires the determination of both **cessation** of cardiopulmonary functions and **irreversibility**.
  - A. **Cessation** of functions is determined primarily by an appropriate clinical examination and confirmed, only when necessary, by hemodynamic monitoring:
    - i. The clinical examination must demonstrate absence of responsiveness, absence of heart sounds, absence of pulse, and absence of respiratory effort.
  - B. **Irreversibility** is determined by persistent cessation of circulatory function during an appropriate period of observation.
    - i. A **five (5) minute observation** time after cessation of circulatory function establishes irreversibility.

Subject: <b>DECLARING DEATH</b>	Effective Date: 3/3/2021	Policy #: <b>ASA 106</b>
	ASA President's Initials: (Initials on File)	

2. When donation of organs after cardiac death (DCD) is planned there is a need to precisely establish the moment of circulatory cessation. In this situation confirmatory hemodynamic monitoring is **mandatory**.
  - A. Absence of circulatory function can determined by:
    - i. Loss of pulse pressure on arterial catheter monitoring  
or
    - ii. Doppler echo study adequate to define the moment of blood flow cessation.  
or
    - iii. ECG silence
      - a. Note: Cardiac electrical activity may persist after blood flow has ceased, therefore ECG silence is **not necessary** for the determination of cessation of function. (For example, pulse-less electrical activity and ventricular fibrillation can be identified as non-perfusing states using the objective measures of blood flow mentioned above)
3. Declaration of death must be made by a qualified physician and documented in the medical record. The documentation must include at a minimum the clinical determinants of death, the time and date of death, and the physician's signature.
  - A. When the declaration of death precedes possible donation of organs, the confirmatory hemodynamic determinants and the 5 minute observation period ensuring irreversibility must also be documented.
  - B. It is recognized that the actual "time of death" is rarely known with objective certainty. Therefore, to standardize the process of documentation, the time of death will be defined as a time no less than 5 minutes from the time of loss of circulatory function.
4. Caveat: If organ donation after cardiac death is a consideration, the physician caring for or declaring and documenting the death of the patient must have no involvement with the recovery or use of organs for transplant.

Resources

1. Report of a national conference on donation after cardiac death. Am J Transplant: 2006; 6(2):281-291

**III. DECLARATION OF DEATH BY NEUROLOGICAL CRITERIA: BRAIN DEATH DETERMINATION POLICY**

Determination of brain death shall be limited to qualified physicians acting in conformity with the procedures set forth below.

**PHYSICIAN QUALIFICATIONS:**

1. **Attending physicians**

For attendings in the Departments of Neurology, Neurosurgery and for attendings granted privileges to provide intensive care in any of the Medical Center's intensive care units, the

Subject: <b>DECLARING DEATH</b>	Effective Date: 3/3/2021	Policy #: <b>ASA 106</b>
	ASA President's Initials: (Initials on File)	

granting of this privilege will require reading this policy and the Brain Death Syllabus (Attachment 106-A) and approval by the Medical Executive Committee. Proctoring must then be successfully completed under the direct supervision of another qualified attending with privileges.

2. **Resident physicians**

Residents must be licensed and deemed competent to perform the brain death examination through appropriate departmental procedures. At a minimum, all residents must read this policy and the Brain Death Syllabus (Attachment 106-A) and successfully complete the Competency Exam (Attachment 106-B) with a minimum passing score of 80% and successful completion of proctoring by a qualified attending to be deemed competent.

3. **Physician disqualification**

Neither the physician making the first clinical examination determination of brain death nor the physician making the second independent confirmation clinical examination may participate in procedures for the removal or transplanting of organs after death.

**PROCEDURES**

1. **INITIATION OF EVALUATION FOR BRAIN DEATH**

An evaluation for brain death may be initiated by a patient's health care team when the patient is comatose and:

- a. There is a confirmed mechanism and/or degree of injury consistent with the level of coma and the injury is deemed irreversible.
- b. There has been a search for and conclusive analysis of all possible confounding factors.
- c. The physical examination is consistent with brain death.

An evaluation for brain death is considered established standard of care when indicated and does not require consent.

2. **PERIOD OF ACCOMMODATION**

- a. Medical teams are required to inform the healthcare decision maker that an evaluation for brain death will take place. The Notice of the Initiation of Brain Death Declaration (Appendix D) should be given to family/surrogate whenever possible.

As soon as the decision is made to initiate an evaluation for brain death, a member of the patient's treatment team shall inform the patient's legally recognized health care decision maker, if any, or the patient's family or next of kin, if available, that if brain death is diagnosed and confirmed according to hospital procedure all ongoing medical interventions, including mechanical ventilation will be stopped at that time.

- b. According to *Section 1254.4 of the Health and Safety Code* a family may request a period of accommodation to facilitate personal, cultural or spiritual needs after the diagnosis has been made and prior to the removal of medical support. They are also entitled to a written statement of hospital policy in this regard upon request.
- c. Period of accommodation statement:

Upon request, and provided that the needs of other patients and prospective patients in

Subject: <b>DECLARING DEATH</b>	Effective Date: 3/3/2021	Policy #: <b>ASA 106</b>
	ASA President's Initials: (Initials on File)	

need of urgent care permit, ventilatory support will be maintained for a reasonably brief period after brain death has been declared to permit those close to the patient to gather at the bedside before that support is discontinued.

When a period of accommodation has been requested, its exact duration will be determined in the light of existing circumstances by the attending physician of record in consultation with the authorized patient representative. It is expected that this time interval will be less than 24 hours.

In case of dispute, the final determination will be made by the medical director of the service.

### **3. BRAIN DEATH DETERMINATION IN ADULTS > 17 YEARS OF AGE**

#### **a. Diagnosis based on a complete clinical examination**

In the event there is no contraindication to or limitation to the performance of a complete clinical brain death examination, a diagnosis of brain death may be made after:

- i. *Determination* of brain death by a clinical examination the findings of which satisfy all the requirements of the Brain Death Form (Attachment C) and Syllabus (Attachment A).
- ii. *Confirmation* of brain death by a second complete clinical examination at least 2 hours later by a second qualified physician.
- iii. If death is diagnosed by 2 complete clinical examinations, at least one clinical examination must be performed by a qualified attending physician. A single apnea test performed by an attending physician may be accepted by the second independent examiner and noted on the brain death documentation form.

#### **b. Diagnosis when a complete clinical examination cannot be performed**

In the event that a complete clinical brain death examination cannot be performed or is contraindicated, a diagnosis of brain death may be made only after the following steps have been completed:

- i. The first examiner will perform a clinical exam as complete as possible given individual patient circumstances. If no contraindication to the diagnosis of brain death is found an approved ancillary study should be performed.
- ii. The results of an approved ancillary study should be read by an attending specialist and documented in the medical record.
- iii. The first examiner can then complete the brain death declaration form, explaining the limitations of the clinical exam and the results of the ancillary study.
- iv. The second examiner can then perform a clinical exam as complete as possible, document review of the ancillary study results and document these as confirming the diagnosis of brain death. No time limit is required between examinations after an ancillary study is confirmatory.

#### **c. Time of death**

The dated and timed documentation of the second independent clinical examination,

Subject: <b>DECLARING DEATH</b>	Effective Date: 3/3/2021	Policy #: <b>ASA 106</b>
	ASA President's Initials: (Initials on File)	

will be the official date and time of the pronouncement of death in the medical record.

**4. BRAIN DEATH DETERMINATION IN CHILDREN > 37 WEEKS GESTATION TO 17 YEARS OF AGE**

**a. Diagnosis based on a complete clinical examination**

In the event there is no contraindication to or limitation to the performance of a complete clinical brain death examination a diagnosis of brain death may be made after:

- i. *Determination* of brain death by a clinical examination the findings of which satisfy all the requirements of the Brain Death Form (Attachment C) and Syllabus (Attachment A).
- ii. *Confirmation* of brain death by a second clinical examination, including a second apnea test, performed at the following time intervals based on age:
  - age 37 weeks gestation to 30 days: 24 hours
  - age 31 days to 17 years: 12 hours
- iii. Additional approved ancillary testing is not required when two complete exams and apnea tests have been performed as above. See section 5 below for indications for ancillary testing.
- iv. BOTH clinical examinations must be performed by different, qualified Attending physicians.

**b. Diagnosis when a complete clinical examination is not possible**

In the event that all elements of a complete clinical brain death examination cannot be performed, a diagnosis of brain death may be made only after:

- i. *Determination* of brain death is made by a combination of a clinical exam, as complete as circumstances allow, that shows no contraindication to the diagnosis, followed by a study of cerebral blood flow that shows no intracranial perfusion or by a study showing absence of brain activity. The results of the study must be interpreted by a qualified attending physician and documented as diagnostic of brain death.
- ii. *Confirmation* of brain death is made by a second clinical examination, performed by an independent qualified physician, as complete as circumstances allow, that also demonstrates no contraindication to the diagnosis of death. The second clinical exam can follow the approved ancillary study without time interval restriction.

**c. Time of death**

The dated and timed documentation of the second independent confirmatory clinical examination will be the official pronouncement of death in the medical record.

**5. BRAIN DEATH DETERMINATION IN INFANTS LESS THAN 37 WEEKS GESTATIONAL AGE**

No determination of brain death will be made prior to the 37<sup>th</sup> week of gestational age.

Subject: <b>DECLARING DEATH</b>	Effective Date: 3/3/2021	Policy #: <b>ASA 106</b>
	ASA President's Initials: (Initials on File)	

**6. CAVEAT IN THE USE OF APPROVED ANCILLARY TESTS OF BRAIN PERFUSION OR FUNCTION**

Approved ancillary testing is required when

- 1) components of the clinical examination or apnea test cannot be safely completed,
- 2) there is uncertainty about the clinical examination,
- 3) a medication effect may interfere with the clinical examination or
- 4) there is a desire to shorten the interval between clinical examinations.

Approved ancillary tests may be used as described above to confirm brain death, if and only if, the qualified attending reading the test is able to give a diagnostically definitive reading. Readings that are noted to be anything less than definitive (i.e. merely "suggestive of...") can not be used to determine or confirm brain death.

**7. DOCUMENTATION**

Physicians determining and confirming brain death should complete the Brain Death Documentation Form (Attachment 106-C) in its entirety or document in the electronic medical record progress notes a clear diagnosis of brain death according to the provisions outlined in the Brain Death Documentation Form.

**ATTACHMENTS**

Attachment 106-A: Brain Death Declaration Syllabus

Attachment 106-B: Brain Death Declaration Competency Exam

Attachment 106-C: Brain Death Declaration Documentation Form

Attachment 106-D: Notification template. Note, to be used as an example. Updating the letter does not require policy approval.

**REFERENCES**

California Health and Safety Code: (sections 7180-7182)

An individual who has sustained irreversible cessation of all functions of the entire brain, including the brain stem, is dead. (Section 7180) (a)(2)

When an individual is pronounced dead by determining that the individual has sustained an irreversible cessation of all functions of the entire brain, including the brain stem, there shall be independent confirmation by another physician (Section 7181)

When a part of the donor is used for...transplantation...and the death of the donor is determined by determining that the individual has suffered an irreversible cessation of functions of the entire brain, including the brainstem, there shall be an independent confirmation of the death by another physician. Neither the physician making the determination of the death under Section 7155.5 nor the physician making the independent confirmation may participate in the procedures for removing or transplanting a part.
